

Change Summary

- Project: codexa
- Worktree: isolated Codexa worktree
- Branch: codex/general/codexa-20260711-codexa-verification-runner-hardening
- Base: main
- Delivery: feature implementation plus exact-head adversarial review fixes

Scope

- Saved the first-principles phase plan and implementation/review record.
- Added fail-closed targeted Playwright Test classification and hardened Vitest, Jest, and Node test proof-weakening modes.
- Unified raw-command, structured-envelope, and package-script runner resolution with explicit child-execution state.
- Rejected informational, opaque, unknown, and value-decoy launcher/prefix forms without losing supported package, workspace, browser, timeout, and wrapper forms.
- Preserved exact npm exec/npx workspace scope and rejected ambiguous aggregate workspace execution.
- Added deterministic real-shell differential tests and production-path regressions; advanced classifier provenance to v4.
- Updated public behavior documentation and repository summary artifacts.

Verification

- git diff --check: passed
- npm run check: passed (113 shell checks; 46 files; 433 tests)
- npm run eval:ci: passed (21 scenarios; score 1)
- npm run benchmark:ci: passed (all thresholds)
- npm run smoke:package: passed (25 checks)
- npm run package:hygiene: passed
- npm audit --audit-level=moderate: passed (0 vulnerabilities)
- Focused runner and differential regressions: passed

Review Hardening

Exact-head reviews closed Yarn launcher routing, false-like filter values, Playwright browser-option support, and non-executing launcher/prefix credit. The final pass also blocked opaque call bodies, option-value decoys, unknown flags, contradicted structured envelopes, and fallback reclassification while preserving later real tool evidence after harmless metadata probes.
