Verification

- git diff --check: passed
- npm run typecheck: passed
- npm test: passed
- Codexa post-edit-review: /srv/.codex/artifacts/codexa/claude-general-codexa-
claude-20260714-135959/codexa-post-edit-review.txt
- Codexa verdict: inspect (advisory)
- Codexa test-plan: /srv/.codex/artifacts/codexa/claude-general-codexa-
claude-20260714-135959/codexa-test-plan.txt
- git diff --cached --check: passed
- staged safety scan: passed

Notes

Downstream completion gates (commit hooks, CI wrappers) currently have to parse the human-oriented post-edit-review text to act on the verdict, and the command always exits 0. This mirrors the existing review --format/exit-code pattern: --format json emits the structured review data, and opt-in --exit-code exits 2 unless completionAuthority is complete or advisoryinspect (missing authority fails closed; testsrequired counts as blocking, consistent with mcpAuthorityBlockReason). Both flags are opt-in ? existing consumers (hooks, wrappers, MCP) see byte-identical behavior.
