

Change Summary

- Project: codexa
- Branch: codex/general/codexa-20260713-184409-focus-orientation
- Base: main at 3d8ac153bafbc6dea5ef792980f0b961f4bc76dd
- Pull request: 104
- Subject: feat(review): add shared committed change receipts

Outcome

Codexa now produces one deterministic committed-change receipt for conventional terminal and CI workflows and for agentic MCP workflows. The shared engine reports the resolved Git range, changed files and statistics, bounded graph impact, optional plan conformance, verification evidence, verdict, gaps, and next actions.

The delivery includes:

- codexa review text, JSON, and GitHub output;
- advanced MCP changereview plus core capabilities.invoke parity;
- a read-only composite GitHub Action;
- codexa init --ci generation of an owned, read-only pull-request workflow;
- packed-package and production-path regression coverage.

Commits

- de1054a feat(review): add shared committed change receipts
- 82ff261 docs(workflow): add PR summary for codexa
- cc661a0 fix(review): require deterministic clean change evidence
- fb34fa2 fix(mcp): expose portable change review plans
- ff3ee26 fix(action): isolate packaged review bootstrap
- fc200c3 fix(review): bind portable plans to validated files
- e2fa398 fix(review): verify snapshot identity before opening

Scope

- Source/config/tests: 21 files, 1,384 insertions, 55 deletions.
- Review artifacts: this Markdown summary and its PDF rendering.
- The Action has read-only repository permissions and does not comment on pull requests. The MCP operation never mutates source; its optional auto-refresh may update Codexa-generated cache and index files.

Adversarial Hardening

Independent reviewers exercised Git correctness, interface parity, and Action/CI delivery against the actual origin/main...HEAD diff. Actionable findings were fixed with dedicated Conventional Commits:

- rejected stale indexes built from dirty overlays;
- fixed rename/copy determinism against hostile diff.renameLimit config;
- bound portable snapshot containment, identity, size, and reads to the same validated file;

- exposed bounded portable-plan input through both MCP access paths;
- isolated npx Action bootstrap from same-name consumer workspaces;
- refreshed stale committed review artifacts after the fixes.

Verification

- npm run check: passed.
- TypeScript and source/release/privacy hygiene: passed.
- Claude Code shell integrations: 113 passed.
- Vitest: 65 files passed; 614 passed, 1 skipped.
- npm run smoke:package: 31 packed-install checks passed, including the isolated Action bootstrap against a same-name/same-version workspace.
- npm run package:hygiene: passed.
- npm run audit: 0 vulnerabilities.
- npm run public:snapshot-check: passed on the committed branch.
- Targeted stale-index, hostile rename-limit, portable snapshot, MCP parity, and Action delivery regressions: passed.

Publication Boundary

The branch provides the Action implementation, but the public Action cannot be called live until the matching release tag and npm package are published. The post-merge release workflow and a real tag-to-npm Action smoke remain required before claiming the new Action is live.
