

PR Summary: Upgrade GitHub Actions setup-node to v7

- Project: codexa
- Checkout: isolated codexa task worktree
- Branch: dependabot/github_actions/actions/setup-node-7
- Base: main
- Dependency commit: build(deps): bump actions/setup-node from 6 to 7
- Follow-up fix: fix(ci): align setup-node release guard

Goal and Outcome

Upgrade every production and publication use of actions/setup-node from v6 to v7 while preserving Codexa's release-path verification. The original bot commit updated the workflows and composite action but left the release guard expecting v6, which made the required check job fail. The follow-up changes that single assertion to v7.

Complete PR Diff

- .github/workflows/check.yml: use setup-node v7 in the check, package-smoke, and benchmark jobs.
- .github/workflows/npm-publish.yml: use setup-node v7 for the release publication job.
- action.yml: use setup-node v7 in the published Codexa composite action.
- scripts/verify-release-path.mjs: require the same v7 reference used by the publication workflow.
- docs/pr-summaries/dependabot-github_actions-actions-setup-node-7/: commit this Markdown summary and its PDF counterpart for review.

No runtime source, package dependency, permission, secret scope, or published command contract changes.

Verification

- npm run check: passed 72 test files; 900 tests passed and 1 intentional skip, plus 28 Claude command and 89 hook checks.
- npm run security:check: passed typecheck, lint, privacy, tests, audit, public snapshot, package/plugin hygiene, and all 31 packed-package smokes.
- npm run benchmark:ci: every hot-path threshold passed.
- git diff --check: passed.
- Staged safety scan: passed.
- Initial adversarial review found this summary omitted the bot commit; the Markdown and PDF were corrected without expanding production scope.

Risk and Rollback

The operational risk is limited to the setup-node action runtime used by CI, publication, and the composite action. The v7 setup step already completed successfully on GitHub-hosted runners. If fresh post-push checks expose a runner incompatibility, revert this PR to restore v6; no data or package migration is involved.
