

Change Summary

- Project: codexa
- Worktree: isolated codexa worktree
- Branch: claude/general/codexa-20260709-025016-focus-orientation
- Base: origin/main
- Commits: 8 (1048508..1c842b5)
- Subject: fix(core): kill false-positive drift blocks, pin node truth, unfreeze MCP routing, prune ghost packets

Scope

Implements F1-F8 of the "functioning optimally" audit plan (adversarially reviewed by four independent reviewers before implementation; all items SOUND-WITH-AMENDMENTS, amendments folded in).

- F1/F2 fix(hooks): stop-hook drift blocks now require recorded edit evidence from the current session (pre-edit session ledger, hashed filenames, mtime GC) and a snapshot younger than CLAUDIOSNAPSHOTBLOCKTTLHOURS (default 24h). A session that edited nothing is never drift-blocked; demotions print their reason.
- F3 fix(git): deleted the production-dead sync getGitState; one 16 MiB cap shared with the review path; truncation/timeout degrade loudly (freshness.degradedGitState + packet gaps) instead of hard-throwing; truncated NUL output clamps to the last complete entry; churn failure records a gap instead of silently zeroing ranking.
- F4 fix(init): untracked host-local wiring pins the exact node binary; tracked/shared files keep PATH-"node"; serve refuses node <22 naming the binary and fix; hook subcommands stay quiet; doctor reports the running binary and flags bare-node PATH-dependence and dangling/undersized pins.
- F5 fix(mcp): root preference recomputed per call (no spawn-time freeze), focus rows written after server start route the next call; explicit workspace routing with no matching row surfaces an envelope warning; plugin env allowlist gains CODEXAWORKSPACESESSION.
- F6 test(init): characterization tests pin that codexa init wires a linked worktree correctly (own config/hooks/fresh index) and that unwired worktrees are invisible; README documents worktree add -> codexa init.
- F7 fix(query): focus/impact/proof-card read-first lists and session banners prune files that no longer exist, surfacing a counted rebuild-the-index gap; banner shows the plugin manifest version and labels stale-index read-first lists.
- F8 fix(mcp): absent worktree data renders knownClean:false + unknown:true (envelope schema + proof card); AutoVerify reports real CODEXAVERSION; CODEXAAUTONOMY documented.

Verification

- npm run check green end-to-end (typecheck, lint, privacy, cmd-smoke, hook-smoke 87 cases, vitest 418 tests / 42 files), exit code 0.
- Live v18 verification on this host: /usr/bin/node dist/cli.js serve refuses with rc=1 naming the binary; doctor warns once and still runs; hook subcommands emit no version noise.

- Doctor node-wiring states exercised live: pinned-ok, dangling-pin fail, bare-node warn.
- New hook-smoke cases: no-edit demotion, TTL demotion, fresh-snapshot block preserved, TTL env override, ledger persistence on the snapshot fast path, ghost pruning, manifest version, stale label, worktree wiring contract.

Notes

- F9 (workspace remediation runbook) is operator-side and runs after this branch lands in the workspace's codexa install.
- Deferred explicitly: H12 session pins/leases (incl. snapshot session binding ? identity-namespace mismatch), fail-closed no-match routing, H5/H6 verdict precision for editing sessions with concurrent foreign changes.
